Notes and exercises from The Cauchy-Schwarz Master Class

John Peloquin

Introduction

This document contains notes and exercises from [1].

Chapter 1

Exercise (1.1). For any real numbers $r_1, ..., r_n$,

$$\sum_{k} r_k \le \sqrt{n} \left(\sum_{k} r_k^2 \right)^{1/2}$$

and

$$\sum_{k} r_{k} \le \left(\sum_{k} |r_{k}|^{2/3}\right)^{1/2} \left(\sum_{k} |r_{k}|^{4/3}\right)^{1/2}$$

Proof. Both inequalities are obtained from Cauchy-Schwarz, the first by taking $a_k = 1$ and $b_k = r_k$ for all k and the second by taking $a_k = r_k^{1/3}$ and $b_k = r_k^{2/3}$ for all k, recalling that $r^2 = |r|^2$ for any real number r.

Exercise (1.2). Suppose $p_k \ge 0$ for $1 \le k \le n$ and $p_1 + \cdots + p_n = 1$. If $a_k \ge 0$, $b_k \ge 0$, and $1 \le a_k b_k$ for $1 \le k \le n$, then

$$1 \le \left(\sum_{k} p_k a_k\right) \left(\sum_{k} p_k b_k\right)$$

Proof. $1 \le \sqrt{a_k b_k}$, so $p_k \le p_k \sqrt{a_k b_k} = \sqrt{p_k a_k} \sqrt{p_k b_k}$. By Cauchy-Schwarz,

$$1 = \sum_{k} p_{k} \le \sum_{k} (p_{k} a_{k})^{1/2} (p_{k} b_{k})^{1/2} \le \left(\sum_{k} p_{k} a_{k}\right)^{1/2} \left(\sum_{k} p_{k} b_{k}\right)^{1/2}$$

The result now follows from squaring both sides of the outer inequality. \Box

Exercise (1.3). For any real sequences (a_k) , (b_k) , (c_k) of length n,

$$\left(\sum_{k} a_k b_k c_k\right)^4 \le \left(\sum_{k} a_k^2\right)^2 \sum_{k} b_k^4 \sum_{k} c_k^4 \tag{a}$$

and

$$\left(\sum_{k} a_k b_k c_k\right)^2 \le \sum_{k} a_k^2 \sum_{k} b_k^2 \sum_{k} c_k^2 \tag{b}$$

Proof. By Cauchy-Schwarz,

$$\left| \sum_{k} a_{k} b_{k} c_{k} \right| \le \left(\sum_{k} a_{k}^{2} \right)^{1/2} \left(\sum_{k} b_{k}^{2} c_{k}^{2} \right)^{1/2}$$

so

$$\left(\sum_{k} a_k b_k c_k\right)^2 \le \left(\sum_{k} a_k^2\right) \left(\sum_{k} b_k^2 c_k^2\right) \tag{c}$$

By Cauchy-Schwarz again,

$$\sum_{k} b_{k}^{2} c_{k}^{2} \leq \left(\sum_{k} b_{k}^{4}\right)^{1/2} \left(\sum_{k} c_{k}^{4}\right)^{1/2}$$

which together with (c) implies

$$\left(\sum_{k} a_{k} b_{k} c_{k}\right)^{2} \leq \left(\sum_{k} a_{k}^{2}\right) \left(\sum_{k} b_{k}^{4}\right)^{1/2} \left(\sum_{k} c_{k}^{4}\right)^{1/2}$$

which implies (a). Also, clearly

$$\sum_{k} b_k^2 c_k^2 \le \left(\sum_{k} b_k^2\right) \left(\sum_{k} c_k^2\right)$$

which together with (c) implies (b).
